Math 1131 Week 10 Worksheet

Name: \_\_\_\_\_

Discussion Section:

Solutions should show all of your work, not just a single final answer.

## 4.7: Optimization Problems

1. A closed box (top, bottom, and all four sides) needs to be constructed to have a volume of  $9 \text{ m}^3$  and a base whose width is twice its length. See Figure 1.

Figure 1: A box

Use calculus to determine the dimensions (length, width, height) of such a box that uses the least amount of material. Justify why your answer corresponds to a minimum, not a maximum. 2. We want to find the points on  $y = x^2$  that are closest to (0,3).

Figure 2: Distance to (0,3) on  $y = x^2$ .

(a) For each point  $(x, x^2)$  on the parabola, find a formula for its distance to (0, 3). Call this distance D(x). (See Figure 5.)

(b) Let  $f(x) = D(x)^2$ , which is the squared distance between  $(x, x^2)$  and (0, 3). Finding where D(x) is minimal is the same as finding where f(x) is minimal. Determine all x where f(x) has an absolute minimum. The points  $(x, x^2)$  for such x are the closest points to (0, 3) on  $y = x^2$ .

3. Three line segments of length 1 are joined together at endpoints to form a base and the legs of an isosceles trapezoid, as in Figure 3. Let  $\theta$  in  $(0, \pi/2)$  be the common angle measurement between the legs and the line passing through the base of length 1. We want to find the angle  $\theta$  that maximizes the area of the trapezoid.

Figure 3: An isosceles trapezoid with base and legs of length 1.

(a) Compute the area  $A(\theta)$  of the trapezoid. The general area formula for a trapezoid is  $\frac{1}{2}h(b_1 + b_2)$ , where h is the height and  $b_1$  and  $b_2$  are the lengths of the bases. (Hint: Break up the trapezoid into a rectangle with two right triangles at both ends. Use trigonometry to compute the height and the length of the longer base in terms of  $\theta$ .)

(b) Find all solutions to  $A'(\theta) = 0$  with  $0 < \theta < \pi/2$ . (The answer is not  $\pi/4 = 45^{\circ}$ .)

(c) Verify that the area  $A(\theta)$  is a maximum, not a minimum, at the angle found in part (b) and compute this maximum area.

## 4.8: Newton's Method

4. Apply Newton's method to estimate the solution of  $x^3 - x - 1 = 0$  by taking  $x_1 = 1$  and finding the least n such that  $x_n$  and  $x_{n+1}$  agree to three digits after the decimal point.

5. The number  $\pi$  is a solution of  $\sin x = 0$  close to 3 (see Figure 4). You will use Newton's method for  $\sin x = 0$  to create numerical estimates for  $\pi$ .

Figure 4: Graph of  $y = \sin x$ .

(a) Write out the recursion for Newton's method used to solve  $\sin x = 0$ .

(b) Using Newton's method for  $\sin x = 0$  with  $x_1 = 3$ , find the first *n* for which  $x_n$  and  $x_{n+1}$  agree to 5 digits after the decimal point. (Use radians, *not* degrees!)

(c) For the *n* you found in part (b), to how many digits after the decimal point does  $x_n$  actually agree with  $\pi$ ?

6. In Figure 5 is the graph of  $f(x) = \ln(x) - 1$  for 0 < x < 4. It crosses the x-axis at x = e. You will use Newton's method for f(x) = 0 to create numerical estimates for e.

Figure 5: Graph of  $y = \ln(x) - 1$ .

(a) Using Newton's method for the equation  $\ln(x) - 1 = 0$  with  $x_1 = 1$ , tabulate  $x_n$  to find the first n for which  $x_n$  and  $x_{n+1}$  agree to 5 digits after the decimal point.

(b) For the *n* you found in part (a), to how many digits after the decimal point does  $x_n$  actually agree with e?
